 (CHF, All Investors)

Data as of 31.01.2019

Investment Objective and Strategy

The fund invests in Swiss equities following a systematic, risk-controlled investment approach with a risk profile like a passive product and the aim to integrate factor returns.

The strategy is based on an investment process that enables to systematically integrate multiple factor returns.

Outset is a portfolio construction, which replicates the systematic risks of the benchmark just like a passive product does. The portfolio construction differs from the passive index replication in terms of stock weighting. In doing so a portfolio is constructed, which aims at generating higher returns than a passive product yet it has a similar risk like a passive product.

Multi-factor Approach in the Swiss Equity Market

The strategy maintains a diversified portfolio of Swiss equities that are selected through a systematic process based on quantitative factor models with the objective to systematically integrate next to the market return additional return drivers (factor returns).

All individual equities are rated based on different factors from the four areas – value, growth, momentum and quality and assigned accordingly in one of five categories.

The portfolio construction shall ensure that systematic deviations are minimized, the overall risk exposure is similar to index products and active risks are controlled.

Factor Returns in the Swiss Equity Market

Based on an efficient and systematic analysis of information from different areas such as

- valuation (fundamental data)
- momentum (price data)
- behavioral finance (analyst estimates)

the universe is divided into five categories which differ significantly by their risk-adjusted return.

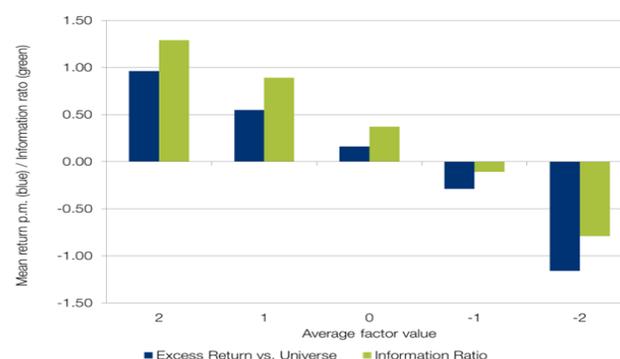

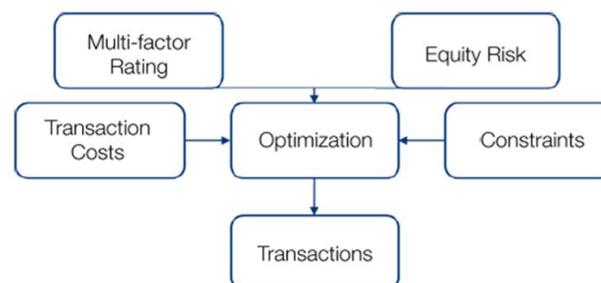

Chart (Right side):
 It shows the value added of the respective quantile based on the multi-factor ranking versus the Swiss equity market.
 Monthly rebalancing, Source: Portfolio Simulation ASCM, January 1997 – June 2012

Systematic and risk controlled Implementation

The strategy is implemented by overweighting shares with high expected premia (high ratings) and underweighting shares with low or negative expected premia (low ratings).

When constructing the portfolio a risk model is applied that takes into account:

- the expected return
- the expected risk
- the transaction costs
- the liquidity

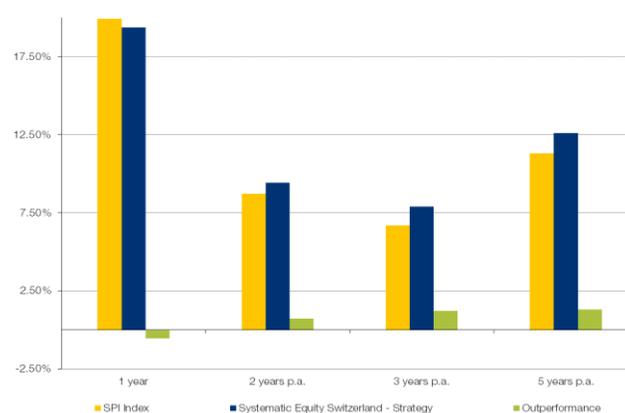

Optimum between active and passive Concepts

Systematic Equity Switzerland aims to enhance passive investment strategies and strives for an optimum between active and passive strategies.

The advantages of passive strategies such as high transparency and liquidity shall be maintained through the systematic and risk controlled implementation.

By the systematic integration of additional factor premia (value, momentum, quality and growth) a portfolio will be constructed that retains an identical risk profile but possesses higher expected returns than a passive product.

We follow a long-standing investment process which makes possible to integrate additional return drivers (factor return) next to the classical market return. For more than five years the investment objective has been achieved with an approach that is theoretically sound, thoroughly tested and in a disciplined manner implemented.

It shows the effective development of the strategy over the past five calendar years (December 2011 to December 2016.) after all implementation costs, before fixed fees

Systematic Equity Switzerland provides investors who strategically hold Swiss equities an investment solution that next to the classical market return systematically integrates additional return drivers and thus represents an alternative to passive investment strategies.
